

## ARE YOU READY FOR A BREACH?

Go beyond penetration testing. Test which hacker tactics your systems can actually detect, and how effectively you respond in the real world.

### THE BENEFITS

- See what attacks you can really catch
- Find blind-spots in your monitoring and response
- Test outsourced response capabilities and vendor SLA's
- Learn how to respond if the real thing hits

### WE SIMULATE THE ENTIRE 'KILL-CHAIN'

#### Delivery

Spear-phishing is an attacker's best friend. We test what kind of mails can enter undetected.

#### Exploitation

We simulate malware infections on internal systems to evaluate the response of the monitoring process.

#### Persistence

Simulate keeping access by brute-forcing accounts and gaining admin rights. See if we are detected.

#### Command & Control

Simulate a compromised system 'phoning home' to an attacker. Does anyone detect and respond?

#### Lateral Movement

Recreate an attacker trying to move around the network. Test if detection systems raise an alarm.

#### Exfiltration

Finally, we simulate the theft of large amounts of information, and evaluate if this event is detected.
